Because electricity is so commonplace, we might not think twice about safety when working around it. But that can be a big mistake. Here's why: According to OSHA, one worker every day is electrocuted while on the job.

That's why you can't take electrical safety for granted. For instance, you should always inspect an electrically powered tool before using it. Make sure the device is clean and dry and double-check that there's no oil residue.

### Using tools properly

While inspecting the tool, confirm that the third prong isn't missing. If it is, electricity can go through your body instead of to the ground. Never use a device that doesn't have a third prong when it should.

Next, inspect the cord. Verify that there are no cuts, frays, or loose components. Then check that the power cord doesn't have any exposed wiring, frays, or taped ends.

When removing the cord, pull on the plug rather than on the cord.

It's also a good idea to test out electrical devices before use. For instance, if it's a power tool, plug it in.

Remember: A tool should be in the "off" position before it's connected to a power supply. If you notice a slight shock, sparks, or smoke while operating a tool, don't jury-rig it; instead, mark the tool out of service and find a replacement.

When working near moisture, use a Ground Fault Circuit Interrupter (GFCI), which monitors the amount of electricity in a circuit and, if there's an interruption of current or leakage, shuts off the power before an electrical shock can occur.

*(In our operation, when might we be required to work with electricity near areas of moisture?)*

### Extension cord safety

Don't forget that extension cords must be used only temporarily; they aren't designed to continuously handle the electrical capacity of heavy-duty equipment. An overloaded extension cord can cause a short circuit,

which can result in a fire or an electrical shock.

Avoid using extension cords in areas where there are a lot of people because there's a chance someone could trip over the cord or wear down the insulated wiring by stepping on it.

If worse comes to worse and you need to use an extension cord around people, tape the cord to the floor or hang it overhead.

Keep extension cords away from oil, water and heat, all of which can cause damage to the cord's insulation and result in an electrical shock.

### Wear the correct gear

Wear rubber gloves and rubber-soled boots or shoes when working around electricity because rubber can prevent electrical current from passing through your body. It's also a good idea to wear a nonconductive hard hat and gloves. Also, put on nonconductive eye and face protection.

Thanks for your attention. And remember, let's stay safe out there!

*(See next page for test)*

## Safety meeting blueprint: Test your knowledge

### Meeting Topic: Electrical safety
